I bought this car without doing research on the Northstar engines. After I hit 101k miles the engine literally lost both head gaskets. I decided that I was going to reseal the engine and put new bearings in it. After doing some research and talking to a local machine shop who is hot tanking the block for me, I found this is the norm for these engines. I was also informed of head bolt hole issues and threads getting pulled out during removal. This may have been an alright car new, but stay away fr om it now as they are all used and well in the mileage range for failure. I paid high book for mine at 90k and now Im going to be negative on this car when I put less than 2000 miles on it. Dont just take my word for it, Google Northstar problems and you will find other issues and warnings. Read less Value Performance Quality Comfort Reliability Styling 12 2 Was this review helpful. When I rev it to 2000 rpm and hold the throttle, it runs somewhat more smoothly, better.Map sensor. searched for vacuum leaks.Im good with wrenching, at a dead end with the trouble shooting, need input. No codes, this is the annoying part. Vaccum related electical whadda you think Many thanks in advance, OlleLook around the spare parts for one and change it if you have a spare one.Pull it and take a look at the pintle seat.If you search rockauto we have 2 discount certificates for 5 percent that you can use.This isnt a 1972 engine that might benefit from something like that. You need to restore the EGR. EGR flow is important for proper combustion on these engines, I believe it cools the incoming charge. I do not recall how the 94 handles a misfire, but I think it does not set a code.Pull the vacuum hose off and check for leaking fuel, if there is fuel replace the regulator. If you have a mitivac apply vacuum and see if it holds.There should NOT be EGR at idle. Check engine vacuum, post your results here plz.Sounds like an overrich condition. You can pull a spark plug and see if they are wet from too much fuel, or a heavy black soot look.Can you get 10w30 standard oilPerform an idle learn procedure. Check the engine vacuum at the booster hose before the check valve. Watch the ISC motor when you move the throttle and ascertain if it is moving

smoothly. I'm not about to give up. Eventually we'll catch it. Any stalling or goofy behavior while tapping would indicate the PCM has gone bad. Sometimes you can find a spot where it will stall or goof up everytime. I took the PCM out and reinstalled it, then again, I did not tap on it while running. I'll try again. You even changed the intake seals. Have you checked the injectors Synthetic flows 7 times better than dyno oil, if the clearances at lifter become excessive the lifter will leak down as the oil will flow around the lifter rather than inflating it when the oil pressure drops low at idle.

Change to 10W30 DYNOL if you can get it, and see how the engine responds, use an ac delco filter. Check to see if the check engine light flashes at 2000 rpm or at highway speeds, I'll bet it stops. GM issued a firmware update to the PCM that took the loping away or at least calmed it down. Can you do me a favor and search your archives to see if you find any mention of this in the service bulletins I would be very appreciative if you have any information on this thank you. Here are all the ones for 1994 STS when searching for PCM. This search was for PCM. I trust if there was a rough idle complaint that was corrected by a PCM firmware update that we would see it in this batch I am sure Bobynski spoke of this. I have been looking for evidence of it for awhile. Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. At idle engine will surge from 600 to 1200 RPM. Most of the time the exhaust smells like it's too rich and is black and some times exhaust is white but does not smell like oil. Had two codes P031 MAP SENSOR SHORTED and P095 STALL DETECTED. Both codes were HISTORY not CURRENT. Cleared the codes and Changed the map sensor last night and the idle has stabilized a little and starting is a little easier. Still have black smoke and sometimes white as well. Ran car for half an hour after map sensor change and no codes present. It just snaps down into place and gets the electronic 3 prong connector. If so, it is exposed to manifold pressure and would not need a vacuum hose like one mounted outside the manifold. How about the FPR Have you checked it for leaks What is the test procedure for the FPR and shouldn't I be getting a code THANKS, CHRIS SCOTTY please ring in on this one as I live less than 10 miles away. I can post that info if needed. I think the 94 has differences compared to my 96.

My top cover has 4 plastic nuts that hold it down, you say you have 12 torx Just remove the inner 4 bolts that are recessed into the cover and the entire manifold will lift up. Have some RTV handy so if one of the gaskets is damaged or torn you can patch it locally with a dab of the RTV. Just scrape the carbon out of the recessed passages with different size screwdrivers and such. Nothing fancy. Those are the small machined notches at each intake port. It is usually pretty clean but it should be checked for carbon buildup. It is going to get sooty again pretty soon so you don't need to be squeaky clean, just clean the majority of the crud out and let it rip. No way around it, just have to remove them and clean them. The 95 and later engines have the one piece injection molded plastic intake with the single point EGR introduction into the intake plenum. Once you know where the Northstar is you can point your ship in the right direction to get home. So the star became a symbol for finding ones way home or more symbolically even finding ones path in life. Is the FPR located under the intake cover that has the 12 torx bolts somewhere near the map sensor. My map sensor did not have a vacuum hose connected to it. Is this correct that it just snaps in under the intake cover with no vacuum hose connected. What are acceptable PSIs and should I get a code from my diagnostics. What are acceptable PSIs and should I get a code from my diagnostics. There isn't a vacuum hose connected to it as the entire cavity is under engine vacuum. If there is, it needs to be replaced. Is this correct that it just snaps in under the intake cover with no vacuum hose connected. The MAP sensor is mounted within the intake manifold, so it gets the vacuum signal directly. I would think the PCM issue would have been found years ago. The car also misses at idle, and at all speeds but is most annoying on the highway. The part number on my PCM is 16180517.

I am unclear after reading the service bulletin which groups of numbers in the bulletin are for the

faulty PCM and which are for the new PCM. Any burps or stalls or other funny business while tapping indicates a bad PCM. Lately it has gotten so bad that when it acts up, the car will stall and then start hard or not at all. I have it at the shop; they have tracked a 5 volt reference through the TP sensor and MAP sensor and a ground and suspect the PCM is the problem. Both sensors have been recently replaced. They suggest I take it to a dealer for further diagnostic before I replace it. Is this a part I can get at GMPARTSDIRECT or elsewhere and install myself Any burps or stalls or other funny business while tapping indicates a bad PCM. What is the test procedure for the FPR and souldnt I be getting a code THANKS, CHRIS SCOTTY please ring in on this one as I live less than 10 miles away. It is located on the drivers side toward the back. It is round and clicks into the fuel rail holder with a nipple on top and has a fuel line attached to it on the bottom that just snaps in place. Turn the key on engine off to pressurize the fuel system. If it is bad it will spew gas like a whale. Do not get an aftermarket FPR, I got one at Advance and it did not last one year. The one I got from NAPA would not fit in the holder. Get a GM one. No codes will set with a faulty FPR on a 94. Make sure you clean all the excess gas out of the intake before reinstalling the cover. If the FPR does not leak, pull the injectors out and see if one is leaking. Once again pressurize the fuel system and no injector should be leaking. Previous cars I have owned and self maintained This condition can be hard on the O2 sensors that may also not be working correctly. The engine will run wide open and may rapidly destroy itself or cause serious engine damage. The top of the 9394 intake manifold is not a decorative piece to just take off, as in later models.

Removing and replacing the top unnecessarily will start to compromise the gasket of the Fuel Rail and will lead to poor sealing, idle and drivability problems. It is from crankcase and gas vapors settling out. If you lose one replace it with the correct screw and isolator combination from the dealer. If the engine starts with the cover off it will runaway; due to uncontrolled air intake. Exercise care or the fuel rail will break. The voltage readout should vary from 01.16 volts. The value should vary frequently; a slow or not changing value means that the sensor is not working correctly. HC failed but CO and NOX were borderline. Replaced all plugs, ignition coils, and wires. Cat also recently replaced. Still failed. Exhaust has always smelled strong of gas IMO. Check codes and P032 and P071 for MAP present. The whole harness, injectors, MAP sensor, FPR, even gas sitting in bottom of intake. Suspecting FPR at this point. Maybe leaking injector. Wondering if that could cause a short. Since MAP and FPR are inside intake, there are no vacuum lines to them. Wondering if there are any other potential areas where a vacuum leak could affect the intake, as I would suspect that this would act the same as a vacuum leak on the line directly to the FPR on most vehicles, and cause a rise in fuel pressure. At any rate, I suspect that a vacuum leak of that nature would not cause all the fuel that I see in the intake area. Will update when repairs complete. Paste as plain text instead Display as a link instead Clear editor Upload or insert images from URL. For the upscale Brougham version, see Cadillac Fleetwood Brougham. For the Brougham as a separate model, see Cadillac Brougham. For the limited production series often carrying the Fleetwood name, see Cadillac Sixty Special. In 1987, a stretched wheelbase car was offered and named the Fleetwood 60 Special, a name which was last used in 1970 for the non-Brougham RWD Fleetwood car.

In 1993, a new rear wheel drive Fleetwood was introduced, but was discontinued after 1996. In 1916 he joined the Fisher Body Company which had been formed by two of his brothers in 1908. Larry as people knew him was one of four of the seven Fisher brothers who brought Fisher Body Corporation under the General Motors umbrella in 1919. In May, 1925 Alfred P. Sloan, then the head of General Motors, appointed Fisher as Cadillac General Manager, an office he retained through 1934. Fisher immediately went to work adding exclusive, custom bodies to the Cadillac range. It began as a small community of craftsmen founded by Henry Fleetwood, Esq. The Fleetwood script and crest would not appear on the exterior of any Cadillac until the 1947 model year when it appeared on the rear deck lid of the Sixty Special. By 1952 it also appeared on the rear deck lid of the Series 75. For 1985, the Fleetwood was actually a DeVille trim option, rather than a separate model. The optional dElegance

package, added tufted button seating among other niceties for the FWD Fleetwood sedan. The Fleetwood coupe was dropped after the 1986 model year, but returned in 1989. The aluminum 4.1 L HT4100 V8 was replaced by the 4.5 L HT4500 for 1988. The engine displacement was increased for 1991 to the 4.9 L HT4900. To visually differentiate from the DeVilles which had also been redesigned, the uppperung Fleetwood and Sixty Special models came with fender skirts over the rear wheels, while the DeVille had full rearwheel openings. The Fleetwood coupe remained on the old 110.8 in 2,810 mm wheelbase, while the sedan's wheelbase increased by 3 inches 76 millimetres. It was replaced by the 200 hp 149 kW 4.9 L HT4900 for 1991. Instead, the Sixty Special nameplate was used on the front wheel drive model for 1993. It was one of the first American front wheel drive vehicles to be returned to rearwheel drive. The DeVille was used again in 1997, after production of the Fleetwood ceased. Retrieved 20111231. Krause publications.

It was replaced by the STS in 2004. Moritz a distant second, trailed further by Seville. A troubled past and difficult pronunciation, respectively, of these contenders ultimately cleared the way for Seville's selection. Master painters Diego Velazquez and Bartolome Esteban Murillo were from Seville. The moniker first entered use as the designation for a two-door hardtop version of the 1956 Eldorado. 1960 was the last model year for the Eldorado Seville, returning in 1967 under a different name. The Seville became the smallest and most expensive model in the lineup, turning Cadillac's traditional marketing and pricing strategy upside down. Cadillac stylists added a crisp, angular body that set the tone for GM styling for the next decade, along with a wide-track stance giving car a substantial, premium appearance. A wide chrome grille flanked by quadruple rectangular headlamps with narrow parking and signal lamps just below the header panel, while small wrap-around rectangular tail lamps placed at the outermost corners of the rear gave the appearance of a lower, leaner, and wider car. Another proposal during its development was a front-wheel drive layout similar to the Cadillac Eldorado. The Seville was thus more nimble and easier to park, as well as remaining attractive to customers with the full complement of Cadillac features. It spawned several imitators including the Lincoln Versailles and the Chrysler LeBaron Fifth Avenue after 1982. To ensure the quality of the initial production run, the first 2,000 units produced were identical in color Georgian silver and options. Total 1976 Seville production was 43,772 vehicles. The first Seville's shared a minority of components with the XBody.
