Use a handheld can opener by opening the arms, positioning the cutting edge, and then rotating the handle to separate the lid. For can opener blades on Swiss Army knives, simply unfold the blade and puncture through the lid of the can. With either can opener, be careful not to cut yourself on any sharp edges! The arms of the can opener need to be in the open position so that the cutting edge can be fitted to the can. Grasp 1 arm of the can opener with each hand and gently pull the arms apart. Keep the arms of the can opener in the open position while you align the cutting edge. Ensure that the cutting edge is resting on top of the lip of the can and that the serrated wheel is lined up in the furrow that circles the can's edge. The cutting edge hangs over the small raised lip adjacent to the furrow. Press the handles of the can opener together. This pushes the cutting edge into the lid of the can. Hold the can opener arms in 1 hand and twist the handle clockwise with your other hand. This causes the serrated wheel to roll around the edge of the can which makes the cutting edge move and puncture through the can. In this case, detach the can opener from the can, reattach it at the last point where the lid was cut, and try again. Once you have almost completely separated the lid from the can, open the arms of the can opener and pull it away from the can. Then use your fingernails or a knife to carefully pry the lid of the can upward so that you can see the contents. It's safe to pinch the flat top and bottom of the lid, but try not to touch the sides. Get your Swiss Army knife and fold out the can opener blade. Hold the can steady with your nondominant hand. Then hold the tip of the can opener blade against the lip of the can and press down firmly. Puncture through the can with the blade to hook the attachment onto the can. <http://agendatourvietnam.com/hinhanh/casablanca-delta-ii-ceiling-fan-manual.xml>

Continue the motion of puncturing the blade through the can and then rocking the handle back to forth to cut further along the can. If you go to remove the lid from the can but you find that it's still attached in some spots, this is an easy fix. Simply place the can opener blade where the lid is still stuck to the can and puncture through the can with the blade. Once the lid is fully separated from rest of the can, you can now carefully take it out. Insert the can opener blade underneath the separated lid and push the lid up gently. Use your fingers to carefully lift the lid out of the can. Clamp down the can opener so the wheel penetrates it and turn the handle to rotate the can opener to start cutting it open. Allow the can to rotate all around the opener and then remove it. Carefully raise the lid out of the can so you can access it. Unfold the opener blade and puncture the lip of the can with the tip of the blade. Hold the can steady and rock the handle of the knife back and forth to start cutting along the can. Continue cutting around the lid until you can lift it up and access the contents. An electric can opener will make a clean cut along the rim and you can use it to fully remove the lid. However, you can also use a manual can opener and cut all the way along the lid until you completely cut through. But, be careful not to drop the lid into the can or you may have to reach into the contents of the can to remove it. How do I open it This is because food residue can build up. This article has been viewed 401,647 times. Next, twist the can opener handle clockwise so the blade rolls along the edge of the lid and cuts it open. Finally, once you've nearly gone all the way around, remove the can opener and carefully use your fingers to lift up the lid. To learn how to use a Swiss army knife can opener blade, scroll down! Roy Hladys 5.0 out of 5 stars Worked well until dropped, second unit worked well until dropped. Ordered another. I found that the ones that had been dropped would no longer work because the battery contacts had bent and were no longer making a reliable connection. Bent the terminals back out to insure contact. I discovered the units have a magnetic safety lock. I placed a knife blade across the magnet that grabs the can lid and the units indeed worked. I now have three openers that work just fine! Every brand has a flaw of some kind stops working after a few months, doesn't know when to stop, gets stuck, doesn't work on all cans, etc. This one has no flaws. It is wonderful! I have two of them. They are used constantly. One is a year old and works like new.

Just bought another one for me and one for my daughter in law. I can't say enough about this little device. So far I have had this about 6 months and after you get the hang of how it works, it is amazing. After I bought mine I had a friend who developed a rare and aggressive cancer in her wrist and had to have her arm amputated. I ordered it again as the perfect gift for her. Get it for camping trips, the elderly, anywhere you need a safe way to open cans quickly, easily and with no mess. May not work well if the rim is dented or uneven. Would give 10 stars if I could. It is cheap, but very high quality with a very good blade which cuts the can perfectly straight and softly. This means that your hand will not cut even if you stroke your hand on the can. You literally click a button and it starts moving by itself like a Roomba. It quickly opens the can and once it's done, it stops and you pick it up. The lid of the can is on it with a magnet, and it can be used as a lid or you can throw it away. Most importantly, the lid of the can does not go in the food, so it is very easy and clean. I love this product so much since it's so practical and easy to use. It requires no effort. This is an amazing product. I would recommend this product to anyone. At first following the instructions to get it off worked. But it kept getting harder each time. Finally the last can I tried to open with it neither I nor my husband could get it off. I finally had to open the bottom with my old hand crank opener to get my greens out. What a mess! I ended up throwing the can with this opener still attached in the trash. I am so disappointed. I had a cheap model and it really just didn't work well from the beginning, but I kept using it thinking I was the problem. This little bugger lets me do other things while its opening the can and I don't have to struggle with the big cans. So far, it has worked on all the sizes I use. Oh, and I tossed the old cheap one.

UPDATE Although I purchased this awesome can opener in December 2014, I have used it very little. As a senior I do not cook often and barely used the can opener. Today, having only one can of kidney beans left to add to the sauce, the can opener quit midway and, despite following the directions on the side of the can opener, I could not get it to work. Also, it would not release from the can. After about 20 minutes bugging up the can to get it to release I finally got it free. I changed the batteries, but new ones did not make it run. Its dead after very little use. I'm really disappointed. As a side note, I forgot to remove the paper label from the outside of the can knowing

that can openers can get stuck in the paper, but I seriously doubt that would cause it to flat out die. Just saying. It is pretty easy to use, and I like that it doesn't leave any sharp edges. The only problem I keep coming across is after it goes all the way around the can, it doesn't always stop like it's supposed to. If there was some kind of eject button on it, that would be great, but there isn't. If you're like me, with weak hands, you may want to stick with the traditional electric can opener. I am now giving this handy can opener one star because after several uses it has now died an untimely death. Sorry, we failed to record your vote. Please try again. Santo 5.0 out of 5 stars I didn't think I could be so excited over a can opener, but seriously it's been the best can opener I've ever owned electric and manual. Like the product description states, I really felt like it ripped through my can of coconut milk like butter. From my experience, the canned items I get from the Asian market seem to be a thicker metal material and my previous can opener would struggle to even make the first puncture. Once that happened, it would never make a straight cut and I'd end up seeing shreds of paper from the label on my counter top and the raised lips along the lid would show the amount of struggle it took just to get it off. Not sure on the longevity of it, but take a chance on this product, it really works as stated. The first time I tried to use it, it locked up after cutting about one inch of a can, and I ended up with the opener in one hand and the loose turning knob in the other it snapped right off. I'm not a very strong person in my 70s and only marginally fit, and it didn't feel to me like I was squeezing or turning any harder than I did with the old can opener which is a bit dull and hard to use, thus the new one. It took me a while to figure out what happened.

There are two gears that mesh when the handle is closed, so the blade and the can guide both turn. Instead of meshing when I went to cut the can, the two gears sat with the tips of two teeth of each gear touching, and just stayed that way. When I squeezed to cut the blade into the can, the gears stayed on the tips of the teeth and still didn't mesh. Instead, the two lower teeth bent as the blade cut into the can. When I started to turn the knob, all was well for the first inch or so around the can, but when the bent teeth got back to the other gear it stopped solidly and the knob snapped off. I tried the old can opener to see if I could balance the gears on two teeth so they wouldn't mesh. I could, a little, but if I started to squeeze they always slipped off and meshed. With this opener, once the tooth tips locked together they would not slip off. The handle has to be opened and the gear turned manually to a place where it will mesh, or the teeth get bent. These need to be manufactured with the gear teeth shaped properly so they can't lock, and made of a stronger material so they don't get damaged so easily. The knob is thin plastic where it attaches to the shaft, and it broke easily. I filled the center of the knob with hot glue and pushed it back on, making it much stronger than it was originally, and straightened the teeth out as well as I could, but they were partly broken. I got finished with my 4 cans, but it still bound a few times. My partner tried it, but the first time it bound it hurt her wrist enough that she refuses to try it again. So now it's just a piece of worthless scrap.

metal. Oh, and I saw another problem while working on it. The blade was nicked up, and I discovered that when closing the handle to put it away, the blade doesn't always go next to the can guide wheel, sometimes it hits it. That's not a situation where it would get squeezed that way just shake it a little and close it again.

But it must have been happening fairly often, because the blade looked nicked all around. The mechanism should be built with enough precision that the blade doesn't hit the other parts. She has arthritic hands. She had no problems using the can opener. The can opener is built very sturdy and is very easy to use. Definitely would recommend for people with wrist problems or arthritis. Is very smooth and easy to turn. I have had trouble with openers in the past, but this one works like a charm. I wish I had gotten one a long time ago! The handles are rounded so it is comfortable to hold but also enables you to apply more grip pressure as needed. The blade is sharp and the magnet really helps to get that lid out of the can without spilling contents. Sturdy and so far very good. I've used it 3 times now, and it opens cans with ease. The 1st time using it, was a little rough, but once it gets broken in, it works perfectly. It cuts the cans and leaves no rough edges. I just hope it lasts for awhile, because it's so hard to find a good can opener that actually lasts these days. Blade rolls smoothly over the lid with no slippage. Grip design is easy to hold. Ease of use for arthritic persons is more problematic, as gripping pressure needed is more challenging. For a woman with arthritis, the grip may be too big and heavy. Great for those not yet needing an electric opener. In order to navigate out of this carousel please use your heading shortcut key to navigate to the next or previous heading.
