First of all, phone recording is not legal in all countries, so you need to check the laws in your area. In particular, this can also vary from state to state in the US - some require both parties to know they are being recorded, while others require only one party to know what is happening. How to Record Phone Calls with Google Voice If you are a Google Voice user, it is very simple. If not, you can always sign up for a Google Voice account and become a Google Voice user. Then this method will be very easy for you too! Hi. Before you can actually record a call, you must first enable the call recording feature. You can do this both online and in the Android app, and the steps are pretty much the same for both. I'm using the internet here, but I'll explain if anything has changed in the Android app. First, launch Google Voice and open the settings menu by sliding down the menu on the left and selecting "Settings".On the web, click Calls. In the Android app, scroll down until you see the Calls section. The final option on the site is "Incoming Call Options," where you can enable the call recording feature or start a conference call. Turn it on with the slider. In the Android app, you need to tap on "Advanced call settings" and then turn on the incoming call options. It's also worth noting that this feature syncs across devices, so you only need to run it in one place or another - once you enable it, it works everywhere. However, this only works if the person is calling you - you can't record the call once you've initiated it, which is a bit strange to be honest. Either way, the next time you need to record a call, just press "4" on the keyboard during a call. An audio prompt notifies both users that the conversation is being recorded. To stop recording, just press "4" again and another prompt will tell you that recording is disabled. The audio file will then be saved to your Google Voice account. Buy. How to Record Phone Calls with ACR While using Google Voice is simple and straightforward, it lacks some of the features many users want, such as: B. Automatically record calls as soon as they are initiated. That's where ACR comes in: not only does it have more options, but it also doesn't alert both users that they're recording. So if you want to secretly record a phone call, this is the tool you need. There are two versions of this app: free and premium. The latter removes all ads from the app and adds some useful features, e.g. B. the ability to record with a contact, start recording in the middle of a conversation, save recordings to Dropbox or Google Drive and much more. However, as always, I recommend trying the free version first to see if it meets your needs. Let's start with that. Once you start ACR, you must accept the terms - vsapplications, but it is legitimate. After accepting the terms of the application, you must grant it all the necessary access rights: contacts, microphone, phone and storage. There is nothing extraordinary about such an application, so go ahead and let it be used in all areas. The application then sends a notification to the shader that it is enabled. When you make or answer a call, recording starts. You literally don't have to do anything - by default all calls are logged. However, if that's not your style, you can change that if you have a premium app. Open the app and then open the menu on the left. Select "Settings" and then "Recording". There are many options in the menu, but scroll down until you see "Start Recording" and change it to Manual. Ready. ACR has a lot more features under the hood, so I definitely recommend looking into it if you plan to do more than just record calls. Again, remember you're paying for advanced features, but I think it's worth the \$3 if you use it a lot. Plus, it's really well-designed, which can be hard to find in a store full of dozens of apps doing similar versions of the same thing. Recording phone calls on Android can be tricky. Although the Google Phone app offers a recording function, its operation depends on carrier, region and other conditions. You can always use an external recording device, but there are plenty of options on your device, from Google Voice to third-party apps. Limitations of Android Recording Google has never been a big fan of Android call recording apps, at least not the third-party ones. In Android 9, the company added restrictions that prevented many apps from recording phone calls. Apps seemed to run, but only silence or ending could be heard when playing the song.Conversation. In Android 10, Google further restricted these types of apps by blocking microphone call recording. In response, many app developers have started using the Android accessibility service to record phone calls. However, Google updated its developer guidelines in April 2022 to state that it does not allow apps on the Play Store to use its accessibility service to record calls. These rules went into effect on May 11, 2022. The company went so far as to label the call recording as spyware. Behavior that can be considered spying on a user can also be labeled as spyware. Google stated this in its developer guidelines. "For example, recording audio or phone calls, or stealing app data." In the past, users could bypass Google's lock by changing the audio source or format, turning up the speaker volume as high as possible, automatically recording instead, or even rooting their phones. Since then, others have started downloading call recording apps through an APK file instead of downloading them directly from Google Play. In all this, the version of Android installed on the phone also depends. Apps for devices running Android 9 and below should still be able to record phone calls without being subject to Google's latest restrictions. However, apps on phones running Android 10 or later that attempt to use the accessibility service may be violating Google's new guidelines. The legality issue Assuming you find a working call recording app, can you legally record a call, especially if you don't ask the other person for permission? The answer depends on where you live. US federal and most state laws allow phone recording if only one party consents (yes, it could be you). However, some states require both parties to consent to the recording. Of course, other countries have their own laws. For full legal protection, ask the other person to do sobefore recording the call.
