KNOWN PROBLEM 1.2: Wall thickness and thermal conductivity. heat flowon one side and the temperature of both surfaces. FIND: whether stationary conditions exist. SCHEME: ASSUMPTIONS: (1) One-dimensional conductivity, (2) Constant properties, (3) No internal energy generation. ANALYSIS: Under steady-state conditions, the energy balance of the specified control volume is 2inoutcond12 ()/12 W/mK(50C30C)/0.01 m24,000 W/m q q k T T L $\hat{a}^2 \hat{a}^2 \hat$ same heat flux is maintained until steady-state conditions are reached, the steady-state temperature difference across the wall is \hat{I} TÂ $\hat{A} = 2/20$ W/m0.01 m/12 W/mK0. 0167 K q L k $\hat{a}^2 \hat{a}^2 \hat{A} \setminus u003d$ \hat{A} which is much less than the specified temperature difference of 20 °C. q $\hat{a} = 20$ W/m 2 L = 10 mm k = 12 W/m K T 1 = 50 °C T 2 = 30 °C q \approx conditional PROBLEM 1.3 KNOWN: Internal surface temperature of the external surface ranging from -15 to 38 °C. SCHEME: ASSUMPTIONS: (1) One-dimensional thermal conductivity in x-direction, (2) steadystate conditions, (3) constant properties. ANALYSIS: From Fourier's law, if x q â²â² and k are constant, it is clear that the gradient x dTdxqk â²â² = is constant under one-dimensional steady-state conditions; and k is approximately constant if it depends weakly on temperature. Heat flow and heat emission at the outside wall temperature T $2^2 = -15$ °C are = $\hat{a} = 0 \text{ o}$. (1) 22xx qqA133.3Wm20m2667W $\hat{a}^2 \hat{a}^2 = \tilde{A} = \tilde{A} = .$ (2) < combination of Eq. According to equations (1) and (2), the heat release rate qB x B can be determined for the temperature range of the outer surface $-15 \div T^2 \div 38$ °C with different thermal properties of the wall.k. For a concrete wall, the heat loss k = 1 W / m K varies linearly from +2667 W to -867 W and is equal to zero at the same internal and external surface temperatures. The size of the heat flux increases with the increases with the increase in thermal conductivity. NOTES: Without stationary conditions and constant k, the temperature distribution on a flat wall would not be linear. -20-10010203040 ambient temperature, T2 (C) -1500-500500150025003500 $\in \mathbb{C}$ Thermal conductivity of the wall, k = 1.25 W/m.Kk = 1 W/m.K, concrete wall = 0.75 W/m.K Out 1. PROBLEM 1.1. KNOWN: Thermal conductivity, thickness and temperature difference in a sheet of rigid extruded insulation. FIND: (a) the heat flux through the 2 m × 2 m insulation sheet and (b) the rate of heat transfer through the sheet. SCHEME: ASSUMPTIONS: (1) one-dimensional conductivity in the x direction, (2) stationary conditions, (3) constant properties. ANALYSIS: from 1.2. the heat flux of the equation is 1 2 x T - TdT q = -k = k dx L $\hat{a}^2\hat{a}^2$ Solution, " x W 10 K q = 0.029 \tilde{A} m K 0.02 m² x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$ < The heat capacity is 2 x x 2 W q = 14.5 m $\hat{a}^2\hat{a}^2$
 < The heat capacity is 2 x x 2 W q = q A = 14.5 m $\hat{a}^2\hat{a}^2$
 Direction heat flow from hot to cold (3) Note that the temperature difference can be expressed in Kelvin or Celsius = 10 °C qcond A = 4 m2 T2T1 k = 0.029 × W m H x D = 20 mm T1 T2 = 10° C Fundamentals Heat and Mass Transfer Issue 7 Incroper Solutions Guide Full load: This is only an example. Download all chapters at: testbankreal.com 2. 1.2. KNOWN PROBLEM: Wall thickness and thermal conductivity. Heat flux applied to one surface and temperature of both surfaces. FIND: Whether stationary conditions exist. SCHEME: ASSUMPTIONS: (1) one-dimensional conductivity, (2) constant properties, (3) no internal energy generation. ANALYSIS: In steady state, the energy balance of the given control volume 2 in out cond 1 2()/12 W/m K(50 C 30 C)/0.01 m 24,000 W/mg q k T T L $\hat{a}^2\hat{a}^2\hat{a}^2\hat{a}^2 = \hat{a} = \hat{a} + \hat{a$ the wall is $\hat{I}T = 2/20 \text{ W/m } 0.01 \text{ m/12 W/m K } 0.0167 \text{ Kq l } ka^2a^2 = \tilde{A} a = \text{ which is much smaller than the specified temperature difference of 20°C. q' = 20 W/m2 L = 10 mm k = 12 W/m KT1 = 50°C T2 = 30°C q'^3 cond 3. KNOWN PROBLEM 1.3: Temperature and thermal conductivity of the inner surface of a concrete wall. INVESTIGATION: Heat loss by$ conduction through the wall as a function of the outside surface temperature in the range of -15 to 38°C. DIAGRAM: ASSUMPTIONS: (1) one-dimensional conductivity in x-direction, (2) stationary conditions, (3) constant and therefore the temperature distribution is linear. The heat flow must be constant in the one-dimensional steady state; and k is approximately constant if it depends weakly on temperature T2 = -15° C is () 21 2 x 25 CdT T T q k k 1 W m K 133.3 W m dx L 0.30 m \hat{a} $\hat{a}\hat{a}^{2}\hat{a}^{2} = \hat{a} = -\hat{a} = 0 \circ$. (1) 2 2 x $x q q A 133.3 W m 20 m 2667 W^{222} = \tilde{A} = \tilde{A} = .$ (2) < union of Eq. (1) and (2), the heating rate qx varintended for the temperature range of the external surface, -15 ÷ T2 ÷ 38°C, with different thermal conductivity of the wall, k. For a concrete wall, k = 1 W/m^2K, heat losses change linearly from + 2667 W to -867 W and is zero when the temperature of the inner and outer surfaces are the same. The magnitude of the heat velocity increases with increasing thermal conductivity. NOTE: Without stationary conditions and constant k, the temperature distribution in a flat wall would not be linear. -20 -10 0 10 20 30 40 Ambient temperature, T2 (C) -1500 -500 500 1500 2500 3500 Heat loss, qx(W) Thermal conductivity, k = 1 .25 W/m.K k = 1 W/m.K, concrete wall k = 0.75 W/m.K external surface 4. PROBLEM 1.4 KNOWN: Dimensions, thermal conductivity and surface temperatures of the concrete slab. Gas furnace efficiency and natural gas costs. FIND: Daily Cost of Heat Loss. SCHEME: ASSUMPTIONS: (1) steady state, (2) one-dimensional line, (3) constant properties. ANALYSIS: The rate of heat loss by conduction through the slab is () () 1 2 T T 7 C q k LW 1.4 W/m K 11 m 8 m 4312 W t 0.20 m â $\hat{A}^\circ = = \hat{a} \tilde{A} = <$ Daily cost the mass of gas that must be burned to compensate for heat loss is () ()g d 6 f qC 4312W USD 0.02/MJ Ct 24 h/d 3600 s/h USD 8.28/d 0.9 10 J / MJη $\tilde{A} = \hat{I} = \tilde{A} = \tilde{A} <$ NOTES: Losses can be reduced by installing a floor covering with a layer of insulation between it and the concrete. 5. PROBLEM 1.5 KNOWN: Thermal conductivity and wall thickness, heat flow through the wall. steady state conditions. FIND: Temperature gradient value in K/m in °C/m. SCHEME: L = 20 mm k = 2.3 W/m K gâx = 10 W/m 2 x ASSUMPTIONS: (1) One-dimensional line, (2) Constant properties. ANALYSIS: Under stationary conditions. k = $\hat{a} = \hat{a} = \hat{a} = \hat{a} = \hat{a} \hat{A}^{\circ} \hat{a}$ < Since the units of K here represent a temperature difference, and the temperature difference, and the temperature difference is the same in both units. NOTES: A negative temperature gradient means that the temperature decreases as x increases, which corresponds to a positive heat flow in the x direction. 6. 1.6. KNOWN PROBLEM: Heat flow and surface temperature related to a wooden board of a certain thickness. FIND: Thermal conductivity in the x direction, (2) stationary conditions, (3) constant properties. ANALYSIS: Using the above assumptions, thermal conductivity can be determined from the equation of Fourier's law. 1.2. Permutation, () L W 0.05 m k=q 40 T T m 40-20 C x 21 2 $\hat{a}^2\hat{a}^2 = \hat{a}$ o k = 0.10 W/m K \hat{a} < NOTES: Please note that temperature of the inner and outer surface of window panes with given dimensions. DEFINITION: Heat loss through a window. CHART: ASSUMPTIONS: (1) one-dimensional conductivity in the x direction, (2) stationary conditions, (3) constant properties. ANALYSIS. Under the above conditions, the heat flow can be calculated according to Fourier's law, equation 1.2. () T T g k L 15-5 CW q 1.4 m K 0.005 m q 2800 W/m. 1 2 x x 2 x $\hat{a}^2\hat{a}^2 = \hat{a}^2\hat{a}^2 =$ and turbine temperatures, shaft dimensions and thermal conductivity. FIND: (a) Comparison of the shaft conductivity with the expected useful power of the device in the range 0.005 m $\leq L \leq 1$ m and the probability of the device L = 0.005 m. turbines. PROPERTIES: Shaft (data): k = 40 W/mâK ANALYSIS: (a) The conductivity of the shaft can be estimated using Fourier's law, which gives () () 2 3 2() 40 W/m K (1000 400) C " / 4 (70 10 m) / 4 92.4W 1m h c c k T T q q A d L Ï Ï ââ â â ° = = = Ã = The ratio of heat conduction speed to useful power is 6 6 92.4 W 18.5 10 5 10 W q r P = = = Ã Ã < (b) The turbine volume is proportional to L3, which is La = 1 m, da = 70 mm and Pa as the shaft length, shaft diameter and useful power is ()()()/4//4/"4(/) 40W/m K(1000 400) C (70 10 m) 1m/5 10 W 18.5 10 m4 = h c h c a a a c a a k T T k T d d L L d L P q A Lrâ Pâ P P L = = = = â â ° Ã Ã = Continued L = 1 m d = 70 mm P = 5 MW Turbine Compressor shaft Th = 1000 °C Tc = 400 °C Combustion chamber k = 40 W/m·K PROBLEM 9 1.8 (Step by Step) The relationship between shaft ratio and useful power is shown below. For L = 0.005 m = 5 mm, the shaft control to useful power ratio is 0.74. The concept of a very small turbine is not feasible because it is unlikely to be able to withstand a large temperature difference between the compressor and the turbine. < NOTES: (1) The thermodynamic analysis does not take into account the effects of heat transfer and therefore only makes sense if heat transfer can be safely neglected, as in the case of the shaft in part (a). (2) Successful miniaturizationDevices are often limited by heat transfer effects that must be overcome through innovative design. Waveguide power to net power ratio 0 0.2 0.4 0.6 0.8 1 L (m) 0.0001 0.001 0.01 0.1 1 r 10. KNOWN PROBLEM 1.9: Width, height, thickness and thermal conductivity single glass and the air gap of double-glazed windows. Representative winter glass surface and airspace temperatures. FIND: Heat loss through single and double glazed windows. DIAGRAM: ASSUMPTIONS: (1) One dimensional conductivity through glass or air, (2) steady state, (3) air trapped in a double window is stagnant (negligible buoyant movement). ANALYSIS: According to Fourier's law, heat losses result from a single panel: ()T 35 C21 2q k A 1.4 W/m K 2m 19600 Wg g L 0.005m $\hat{a} = \hat{a} = o < double panel: ()T 7 25 C21 2q k A 0.024 2 m 120 Wa a L$ 0.010 m = = 0 < NOTES: Single pane losses are unacceptable and will remain excessive even when the glass thickness is doubled to accommodate the air space. The main advantage of the double-glazed construction is the low thermal conductivity of the air (~60x lower than in the case of glass). With a constant outside air temperature, the use of a double-glazed design would also increase the temperature of the glass surface exposed to the indoor (inside) air. 11. PROBLEM 1.10 KNOWN: Freezer compartment dimensions. Inner and outer surface temperatures. FIND: (1) Perfectly insulated ground, (2) One-dimensional conduction through 5 walls with an area of A = 4m 2, (3) Stationary conditions, (4) Constant properties. ANALYSIS: Using Fourier's law, the equation. 1.2, the rate of heating is q = q A = k T L Total $\hat{a}^2 \hat{a} \hat{1}$ Solving for L and finding that Total = 5 Å T W q 2 $\hat{1}$ () () 5 0.03 W/m K 35 - 10C $4m L = 500W 2\hat{a}; \hat{a} \approx \tilde{A} \hat{a} \hat{e}$ about L = 0.054m = 54mm. < COMMENTS; will lead to a local deviation from one-dimensional thermal conductivity and somewhat large heat losses. 12. 1.11. KNOWN PROBLEM: Heat flux on one flat wall surface and air temperature and convection coefficient on the other side. The temperature of the surface exposed to convection. FIND: If stable conditions exist. If not, then the temperature is rising or falling. SCHEMATIC: ASSUMPTIONS: (1) One-dimensional conductivity, (2) No generation of internal energy for the control volume around the wall gives st v dE E E E dt = $\hat{a} + \& \& []$ st v 2 2 2 () () 20 W/m 20 W/m K(50 C 30 C) 380 W /m s dE q A hA T T q h T T A dt A A $\hat{a} \hat{a}^2 \hat{a}^2$ and the wall reaches stationary conditions. qv = 20 W/m2 Ts = 50 °C h = 20 W/m2 K Tv = 30 °C Air qconv 13. PROBLEM 1.12. KNOWN: Dimensions of food/beverage containers and their thermal conductivity. Internal and external surface temperature. WE FIND: The heat flow through the container wall and the total heat load. SCHEMATIC: ASSUMPTIONS: (1) stationary conditions, (2) negligible heat transfer through the bottom wall, (3) uniform surface temperature and one-dimensional conduction. 1.2 is the heat flow ()0.023 W/m K 20 2 CT T 22 1q k 16.6 W/m L 0.025 m â ââ â²â² = = = o heat load ()q q A q H 2W 2W W tot 1 \hat{a}^2 1 2 $\hat{a}^2\hat{a}^2\hat{a}_i$ $\hat{a} = \tilde{A} = + + \tilde{A}\hat{a}\hat{\pm}\hat{a}_i$ () () 2q 16.6 W/m 0.6 m 1.6 m 1.2 m 0.8 m 0.6 m 35.9 m 35.9 m 35.9 m 35.9 m container corner: + + $\tilde{A} = \hat{a} \hat{\pm} \hat{a}_i$ and edges cause local deviations conductivity, which increases the heat load. However, the influence of H, W1, W2 >> L is negligible. 14. 1.13. KNOWN PROBLEM: A masonry wall of known thermal conductivity has a thermal index equal to 80% of the heat transfer coefficient of a composite wall of recommended thermal conductivity, (3) steady-state conditions, (4) constant properties. ANALYSIS: Under steady conditions, the flow of heat conduction through a one-dimensional wall is given by Fourier's law, Eq. 1.2, $\hat{a}^2 \hat{a}^2 q = k$ TL $\hat{1}$ where $\hat{1}T$ denotes the difference in surface temperatures. Since $\hat{1}T$ is the same for both surfaces, it follows that L = L k k q q1 2 1 2 2 1 $\hat{a} \hat{a}^2 \hat{a}^2$ mm 0.75 W/m K 0.25 W/m K 1 0.8 = 375 mm.1 \hat{a} \hat{A} < NOTES: I do not know the temperature difference at on both sides of the walls, we do not find the variable thermal conductivity of the wall. Constant heat flow. Temperature at x = 0. FIND: Expression for temperature gradient and temperature distribution. SCHEMATIC: ASSUMPTIONS: (1) One-dimensional conductivity. ANALYSIS: The heat flux is given by Fourier's law and is known to be constant, so x dT q k constant dx $\hat{a}^2\hat{a}^2 = \hat{a} =$ Solving for the temperature gradient and substituting the expression for k gives x xq qdT dx k ax b $\hat{a}^2\hat{a}^2 = \hat{a} = \hat{a} + \hat{a}$ Since the expression can be integrated to find the temperature distribution as: xqdT dx dx ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a}^2 \hat{a}^2 = \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} \cdot \hat{a} + \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} + \hat{a} + \hat{a} \cdot \hat{a} + \hat{a} \cdot \hat{a} + \hat$ 16. Problem 1.14 (Continued) 1 x 1 x 1 T(x 0) T q ln b c T a q c T ln b a = $\hat{a}^2 \hat{a}^2 \hat{a} + = = +$ Therefore, the temperature distribution is given by () x x 1 q q T ln ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a} + + + < x 1 q b T$ ln a ax b $\hat{a}^2 \hat{a}^2 = \hat{a}^2 \hat{a}^2 \hat{a}^2 = \hat{a}^2 \hat{a}^2 \hat{a}^2 = \hat{a}^2 \hat{a}^2$ function of temperature. Non-linear temperature distributions can also arise when there is internal energy production or when non-stationary conditions are present. 17.1.15. KNOWN PROBLEM: Thickness, diameter and temperature of the inner surface of the bottom of the pot used to boil water. The rate of heat transfer in the pan. CONCLUSION: temperature of the outer surface of the vessel for aluminum and copper bottoms. SCHEME: ASSUMPTIONS: (1) One-dimensional stationary conduction through the bottom of the vessel is T T1 2q kA L ≈ = So qL T T1 2 kA = + where ()22 2A D / 4 0.2 m / 4 0.0314 m T 110 C 110.24 C1 2390 W/m K 0.0314 m = + = o o < NOTES: Although the temperature drop at the bottom is slightly greater for aluminum (due to its lower thermal at T = 110 °C, which is a desirable property for pots and pans. 18.1.16. KNOWN ISSUE: Chip dimensions and thermal conductivity. The power is distributed over one surface. DETECTED: Drop in chip temperature. SCHEME: ASSUMPTIONS: (1) steady-state conditions, (2) constant properties, (3) uniform heat dissipation, (4) negligible rear and side heat losses, (5) one-dimensional thermal conductivity of the chip. ANALYSIS: All electrical energy dissipated on the back surface of the chip is carried by the chip. Thus, from Fourier's law P = q = kA T t O or () t P 0.001 m 4 W T = kW 150 W/m K 0.005 m2 ∞ Γ O = ∞ OT = 1.1 C.o < NOTES. At constant P, the temperature drop across the crystal decreases with increasing k and W and decreasing t. 19. 1.17. KNOWN ISSUE: Heat flow and convective heat transfer of a boiling dielectric fluid. FIND: The temperature of the upper surface of the plate when water boils. Is it planned to reduce the surface temperature with a dielectric liquid. DIAGRAM: Tsat, $d = 52^{\circ}C q'' = 20 \times 105 W/m2$ Tsat, $w = 100^{\circ}C hw = 20,000 W/m2$ K hd = 3000 W/m2 So sat /st T q hâ²â² = + When the liquid is water, 5 2, saturated ., 3 2 20 10 W/m / 100 C 200 C 20 10 W/m K s w wT T q h $\hat{a}^2\hat{a}^2$ = + = ° + = A° + = surface temperature < NOTES: (1) Although the dielectric fluid has a lower saturation temperature, which is more than offset by the lower heat transfer coefficient associated with the dielectric fluid, the surface temperature of the dielectric fluid has a lower saturation temperature of the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower saturation temperature of the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with the dielectric fluid has a lower heat transfer coefficient associated with transfer coeff dielectrics, but are used in applications such as immersion cooling of electronic components where an electrically conductive heat exchange with moving air and water. FIND: Determine which state is colder. Compare these results with a heat loss of 30 W/m2 under normal room conditions. DIAGRAM: ASSUMPTIONS: (1) The temperature on the surface of the hand and the environment in the case of airflow. ANALYSIS: The hand will be cooler because the position causes more heat loss. Heat loss can be determined by Newton's law of cooling, Eq. 1.3a, written as ()sq h T Tââ²â² = â For air flow: () 2 a water 900 W m K 30 5 K 1400W mâ²â² = â for air flow = a for air flow at a given temperature and convection speed. In contrast, heat loss in a normal room environment is only 30 W/m2, which is 400 times less than air flow loss. A hand surrounded by a room would feel comfortable; in currents of air and water, as you probably know from experience, the hand would become uncomfortably cold because the heat loss is too great.
